Methods and Materials
The City of El Paso Department of Public Health (CEPDPH) Medicaid Waiver program utilized the REAL survey to identify the health and immunization needs in the prioritized population. Persons 13 to 24 years of age were screened to determine if they were referred to or completed the HPV series and were linked to services using a voucher system. The following strategies were implemented by the CEPDPH Medicaid Waiver program to increase the immunization rate in El Paso County, TX.

Community Outreach
• Outreach to persons throughout El Paso, TX
• Referrals to CEPDPH immunization to receive services

Bridging Preventive Medicine and Immunization Clinics
• Preventive Medicine Clinic screens vaccination history during routine testing
• Same day services received from the immunization clinic if vaccine is needed.

Education and Partnerships
• Collaborations with local university and community organizations to increase the knowledge and awareness of receiving the HPV vaccine.
• Focus on “cancer prevention” and not the “mode of transmission.”

Results
The City of El Paso Department of Public Health vaccinated 3055 persons ages 13-26 from with the HPV vaccine from January 2016 - December 2017. The Medicaid Waiver program linked 366 participants to continue and/or begin the HPV vaccination series by conducting onsite vaccination at community outreaches and same day vaccination during testing at clinic.

• 69 participants that initiated the first dose elsewhere, 52% completed the 3 series vaccine
• 297 participants that initiated the first dose with the Medicaid Waiver program 12% completed the 2nd dose
• Concurrent vaccination from participants vaccinated with 2nd dose, 68% completed the series

Lessons Learned and Discussion
• New ways to inform and recruit participants to the program are being implemented to test effectiveness.
• To reduce barriers, the CEPDPH Teen Initiative focuses on onsite school vaccinations and prescreen participants before the vaccine event.
• Collaboration agreements with community organizations to do follow-up with participants and give incentives for completion of immunization series.
• Health Educators and Disease Intervention specialists will contact participants to give information on community outreaches close to participant’s location
• Create reminders on participant’s cellphone to remind them to get the next HPV vaccine.
• To increase time at outreach event, the Medicaid Waiver program is retrofitting a mobile unit that can keep vaccines at a viable temperature.

Background and Purpose
Seventy-nine million Americans are infected with the Human Papillomavirus (HPV). Those affected most by HPV are those in their late teens and early 20s (Genital HPV Infection – Fact Sheet, 2017). Although in most cases HPV does not cause serious health problems, in women, certain strains can alter normal cells on the surface of the cervix into cancerous cells leading to cervical cancer (Human Papillomavirus infection, 2017). According to the CDC, “White and Hispanic women had higher rates of HPV-associated cervical cancers than any other races of non-Hispanic women,” and Hispanic men had higher rates of HPV-associated cancers than white and non-Hispanic men did. The City of El Paso is predominately Hispanic with an 80.96% making up its entire population. Persons under the age of 24 make up 38.81% of the city’s population (Paso Del Norte Institute for Healthy Living, 2018). The City of El Paso Department of Public Health (CEPDPH) Medicaid Waiver program aims to increase HPV immunization rates through the collaboration with CEPDPH’s internal Preventive Medicine clinic, immunization clinic, and community organizations. The Medicaid Waiver program serves the El Paso, TX, population by increasing access to immunizations and health screenings. The program staff identify persons who are in need of select health screenings and immunizations by using the Race, Ethnicity, and Language (REAL) interview survey and linking them to services. Participants are connected to services using a voucher system with CEPDPH clinics and/or private physicians.

Challenges
• Teens rely on parents or others for transportation to the clinic to receive immunization services.
• Participants’ phone numbers are often disconnected or changed and follow up calls by the Health Education and Prevention Specialist cannot be completed.
• Underage participants need parental approval and consent to receive vaccine and cannot make the choice on their own.
• Mobile Immunizations team faces challenges in maintaining vaccine temperature during outreach events.
• Participants are reluctant to give consent for the HPV immunization because of previous beliefs.

Acknowledgments
Data reported by the Teen Health Initiative in this poster was supported by the CEPDPH Medicaid Waiver program with funding from the Health and Human Services Commission as part of the Centers for Medicare and Medicaid Services 1115 Medicaid Waiver.

Thank you to all of the organizations that contributed with participant recruitment and service delivery including the University of Texas at El Paso and University of Texas Health Science Center at Houston in El Paso. Lastly, thank you to the CEPDPH’s contributed support to health educators, disease intervention specialist and clinic staff to provide services as part of the Medicaid Waiver program, Preventive Medicine clinic and Immunization clinics.
